Abstract

Let (L, C) be the (up to isomorphism unique) countable homogeneous structure carrying a binary branching C-relation. We study the reducts of (L, C) , i.e. the structures with domain L that are first-order definable in (L, C) . We show that up to existential interdefinability, there are finitely many such reducts. This implies that there are finitely many reducts up to first-order interdefinability, thus confirming a conjecture of Simon Thomas for the special case of (L, C) . We also study the endomorphism monoids of such reducts and show that they fall into four categories.

The notion of cycle-free partial order (CFPO) was defined in [9] and the class of sufficiently transitive CFPOs was investigated, and in many. In this work, the class of cycle-free partial orders (CFPOs) is defined, and the CFPOs fulfilling a natural transitivity assumption, called k -connected set. P. Creed, J.K. Truss, R.
